Abstract (en)
A system for cooling of electronic equipment, comprising two heat transferring loops (1, 10) each of which including a heat dissipation unit (2; 20) for receiving heat from at least one electronic component (3; 30), a radiator (4; 40) receiving heat from the heat dissipation unit (2; 20) and a fluid loop (5a, 5b; 50a, 50b) connected to both ends of the heat dissipation unit (2; 20) and the radiator (4; 40), respectively, wherein pressurized fluid is arranged to flow in the fluid loop (5a, 5b; 50a, 50b) and through the heat dissipation unit (2; 20) and the radiator (4; 40); and a fluid flow connection (100) between the dissipation units (2, 20) and between the fluid loops (5a, 5b; 50a, 50b) for oscillating fluid movement between the heat dissipation units (2, 20) and between the fluid loops for forcing generated vapour slug (6, 60) alternately from either heat dissipation unit (2, 20) to the respective radiator (4, 40).
