Abstract (en)
[origin: CA2947883A1] The present invention relates to a buckle for releasable load coupling of two elements, in particular for an object that can be worn on the human body, in particular a ballistic vest, comprising a first and a second buckle component, each of said buckle components having a connection area via which one of the elements is connectable to the buckle component, and a coupling area via which the buckle components can be coupled to one another in a form-fit manner, wherein the buckle components are releasably locked to one another at the coupled position by means of a locking element, wherein each of the coupling areas of the buckle components is defined by a hook profile extending in the width direction, wherein said hook profiles of the buckle components are configured as complementary elements and interengage at the coupled position of the buckle components.
