Abstract (en)  
An event data recorder with intelligent switching function includes a central control device, a GPS unit used for generating a locating signal, a gyroscope used for generating a direction signal, an acceleration sensing unit used for generating an acceleration signal, and a recording device. The central control device has at least one processing chip and a plurality of circuit units. The GPS unit, the gyroscope, the acceleration sensing unit, and the recording device are respectively electrically connected to the processing chip via the circuit units. The locating, the direction, and the acceleration signals are sent to the central control device to instantly determine whether or not to activate the recording device when they are detected not in a predetermined range.
