Abstract (en)

[origin: WO2016005183A1] The invention concerns an air cooling system comprising a cooling battery traversed by a vertical air stream and at least one fan disposed above the cooling battery. The fan discharges the cooled laminar air stream in the top part of the system, and said air stream is drawn in in the bottom part. The thicknesses of the middle parts comprising the cooling battery and of the bottom part comprising a suction grille are less than that of the top part containing the at least one fan. In this way, the middle and bottom parts are thinner than the top part, thus allowing goods to be stored closer to the cooling system.
