Abstract (en)
[origin: US2017138109A1] A water-conducting domestic appliance includes a washing container, a door which is pivotably mounted to the washing container to define with the washing container a washing chamber for washing items, and a door opening module configured to automatically open the door. A detector detects a presence of a living being in a defined area in front of the domestic appliance. In the event the presence of a living being has been detected by the detector in the defined area, a control device prevents the door opening module from automatically opening the door.
