Abstract (en)

[origin: WO2016008993A1] The invention relates to a method for operating a device (1) for producing printed matter, said device having an unwind unit (2) to provide paper to be printed, wherein: a print unit is arranged downstream of the unwind unit (2), which print unit prints the paper; a cross cutter (4) is arranged downstream of the print unit, which cross cutter cuts the printed paper that is continuously fed to said cross cutter, the cutting being transverse to the feed direction, such that individual printed sheets are provided; a collection unit (5) to collect the sheets fed to the collection unit is arranged downstream of the cross cutter (4); a feed unit (6) is arranged downstream of the collection unit (5); at least one additional unit to finish the printed matter to be produced is arranged downstream of the feed unit (6); and wherein the units upstream of the cross cutter (4) and/or the cross cutter (4) are operated in accordance with the processing speed of at least one of the units located downstream of the cross cutter (4).
