Abstract (en)

[origin: WO2016014356A1] Laves phase-related BCC metal hydride alloys historically have limited electrochemical capabilities. Provided are a new examples of these alloys useful as electrode active materials. Also provided are processes of activating such alloys. Alloys include a composition defined by Formula I:  $Ti_wV_xCr_yM_z$  (I) where  $w+x+y+z = 1$ ,  $0.1 < w < 0.6$ ,  $0.1 < x < 0.6$ ,  $0.01 < y < 0.6$  and M is selected from the group consisting of B, Al, Si, Sn and one or more transition metals that achieve discharge capacities of 350 mAh/g or greater for cycles of 10 or more.
