Abstract (en)
[origin: EP3173659A1] An externally toothed gear (4) of a dual-type strain wave gearing (1) is provided with first and second external teeth (7, 8) having different teeth numbers, and is flexed into an ellipsoidal shape by a wave generator. When the theoretical values (d_1 , d_2) of the radial flexing amounts at major-axis positions of the first and second external teeth (7, 8) flexed into the ellipsoidal shape are expressed by $d_1 = m_1 n_1$ and $d_2 = m_2 n_2$ (m_1 and m_2 represent the modules of the first and second external teeth, and n_1 and n_2 represent positive integers), the radial flexing amounts (d_{1a} , d_{2a}) of the first and second external teeth (7, 8) flexed by the wave generator (5) satisfy $d_{1a} = \frac{d_1}{m_1}$ and $d_{2a} = \frac{d_2}{m_2}$, where $1.25 \leq \frac{d_2}{d_1} \leq 3$. Accordingly, a dual-type strain wave gearing can be achieved with which the first and second external teeth having different numbers can be suitably flexed to form excellent mating states with respective internally toothed gears.
