Abstract (en)

[origin: WO2016015704A1] The invention relates to a device for actuating drives for movable protection systems, in particular weather protection systems, in particular sun protection systems, in particular roller shutters, comprising: a means for generating current from sunlight, a means for storing current, and a controller. The means for storing current and the controller are arranged in at least one separate section of a first profiled means, in particular two sections, in particular in a separate first profiled means, in a separately removable manner. The means for generating current from sunlight is accommodated in a separate second section of the profiled means, in particular in a second profiled means, and the second section, in particular the second profiled means, is adapted to the first section, in particular the first profiled means, such that a uniform structural design of the profiled means is provided, in particular at a connection point with respect to size and shape, and the sections in particular, in particular the profiled means, are secured to one another in a releasable manner by means of connecting means.
