Abstract (en)
   An embodiment of the present invention provides a male underwear, which can maximize a ventilation effect around the skin of the scrotum to effectively cool the scrotum and the testes in the scrotum by separating the penis from the scrotum to completely separate the foreskin of the penis from the scrotum, isolating the scrotum from the inner thighs to prevent the scrotum from coming into direct contact with the inner thighs, and exposing the scrotum to the external air to then be suspended. To this end, the male underwear includes a panel-shaped first fiber member allowing the penis to be spaced from the scrotum by erecting the penis in the opposite direction of the scrotum, a panel-shaped second fiber member downwardly extended from the first fiber member and allowing the scrotum to be spaced from the inner thighs, and a first opening formed between the first fiber member and the second fiber member and allowing the scrotum to be protruded to the external air, wherein the second fiber member is divided into two members by the first opening.
