Abstract (en)

[origin: WO2016023135A1] The invention relates to methods for specifically gripping and separating out individual articles (5) which are conveyed one after the other in a conveying direction (F) on a sheet-like conveying mechanism (2). A position-determining device picks up a piece of information relating to the position of the article (5) which is to be separated out. The article (5') which is to be separated out is displaced transversely to the conveying direction (F) by means of a pusher (4), the pusher (4) being moved into the conveying region of the articles (5) in a direction transverse to the conveying direction (F). The pusher (4) is then moved, prior to the article (5) being pushed, into an advancement position (Vp), in which it is located in the conveying region, above the conveying mechanism (2). The article (5) is then pushed over the conveying mechanism (2) by the pusher (4) by virtue of the pusher (4) being accelerated from the advancement position (Vp) in a pushing direction (S). The advancement position (Vp) is defined by a control device (14) in dependence on the information relating to the position, on the conveying mechanism (2), of the article (5) which is to be separated out.
