Abstract (en)

[origin: CA2961689A1] The invention relates to an active part (S) for an electric machine (E). The active part (S) can be designed as a stator (S) or a rotor (10) and has at least two slots (14) for arranging a respective electric coil winding (16) of an electric coil (W) and at least one connecting piece (22) arranged between adjacent slots (14) for conducting a magnetic flux (30) through the coil. The electric machine (E) is to have a high efficiency. For this purpose, the connecting piece (22) has a material (36) for conducting the magnetic flux (30), said material having a magnetic anisotropy at least in some regions with a light magnetization axis (38) and a hard magnetization axis (40). The light magnetization axis (38) is aligned parallel or at least at an angle of less than 25° to a coil axis (M) of the coil (W), which surrounds the connecting piece (22).
