Abstract (en)

[origin: WO2014135265A1] An arrangement for transforming a planar support (2) comprises: • - first and second rotating cylindrical transformation tools (16, 17), arranged and cooperating together to transform the support (2), • - first and second side bearings (26, 27), holding the first tool (16) for rotation (Rs), • - third and fourth side bearings (29, 31), holding the second tool (17) for rotation (Ri), • - adjustment means (42) in the form of spacers (43, 44, 46, 47) having an inclined face (48) and sliding (S) to adjust the respective distance (e, e1, e2) between the first and third bearings (26, 29) and between the second and fourth bearings (27, 31), so as to set a radial gap (20) between the two tools (16, 17). The adjustment means (42) comprise two spacers (43, 44) interposed between the first and third bearings (26, 29), and two bearings (46, 47) interposed between the second and fourth bearings (27, 31). In another solution, either an alternative to or working in cooperation with the first solution, the spacer (43) is moved (S) by a differential screw (57) having a first thread (58) that engages with a tapped hole (59) in an integral part (61) of one of the bearings (29) and a second thread (62) different to the first thread (58) and engaging with a tapped hole (63) in the spacer (43).
