Abstract (en)

The present invention provides a carton (11) for a bag in box packaging. The carton has the overall configuration of a rectangular parallelepiped, with two pairs of opposing sidewalls and an upper end portion and a lower end portion, together defining a cavity for receiving a liquid holding bag. In the lower end portion there are a first pair of opposing flaps (53, 54) and a second pair of opposing flaps (51, 52). The carton further has an opening (13a) extending through one sidewall (14b) in the lower end portion for dispensing liquid from a bag positioned inside the cavity. According to the invention the first pair of opposing flaps are foldable into an open position, in which the flaps extend outwards from the cavity to form a pair of legs. The legs are interlockable with a flap (51) of said second pair of flaps so as firmly to fix the position of the legs with regard to the carton. The leg-forming flaps support the carton in an elevated position with respect to a surface thus facilitating dispensation of liquid through the opening.
