Abstract (en)

The invention relates to a flashing (11-14) having a first leg adapted for lying substantially in the plane of a roof (2) between battens (4) and a roofing (3) and a second leg adapted for extending at an angle with respect to the first leg and lying substantially parallel to an outer side of a roof window (1). The flashing (11-14) comprises a sealing element made from a compressible insulating material (102') and attached to the first leg on the side facing the roofing (3). The sealing element is made from a slit material or a material with weakening sections forming a series of weak walls, which will break in appropriate places when the material is compressed. In one embodiment the slits (105') or weakening sections extend in the height direction from the second side, and in a plane, which is substantially perpendicular to a length axis of the sealing element. The invention also relates to a tile support comprising a sealing element made from a compressible insulating material with slit (105') or weakening sections.
