Abstract (en)  
[origin: CA2958504A1] License plates (10) and number plates of vehicles are often forged or used for other vehicles. To prevent this, license plates (10) are known which have contactlessly readable identification means (19) located in a license plate surface (12). Said identification means (19) contain relevant data about the vehicle to which the license plate (10) belongs. As the license plate surface (12) is primarily provided for motor vehicle identification or as a surface for marking (15) with numerals or letters for identification, only a little or limited space remains for additional identification means (19). The invention creates a license plate (10) for a vehicle comprising an identification means (19), in which the at least one identification means (19) is located at the edge (13) of the license plate (10) surrounding the license plate surface (12).
