Abstract (en)

[origin: WO2016027032A1] The invention relates to an apparatus including two separate assemblies, comprising a stationary block (12) including a motor (16) and a vacuum pump (14), and a movable head (20) including a switch for controlling the motor and a suction nozzle coupled with a valve (32) of the sealed container (28, 30). The stationary block and the movable head are joined by a flexible dual cord, wherein a pneumatic cord (22) connects the vacuum pump to the suction nozzle, and an electrical cord (36) connects the control switch to the electrical motor. The two cords are spiraled coaxial cords that are resiliently and jointly extendable from a rest position, in which the movable head rests on the stationary block, to an operative configuration, in which the movable head remains coupled to the container as a result of the suction, remote from the stationary block.
