Abstract (en)
[origin: WO2016026787A1] The invention relates to an electrical connection terminal comprising a terminal housing which is composed of an electrically insulating material, wherein the terminal housing has at least one single-ended opening for inserting one or more conductor ends, comprising an at least two-part terminal body which comprises a moving part and a fixed part and which has a contact area for making contact with the respective conductor end, wherein the respective conductor end is held in the terminal body in a force-fitting manner, and also comprising a means for preventing plug-connection from beneath which closes off the clearance in the opening in the terminal housing, which clearance remains depending on the respective position of the terminal body in the terminal housing. According to the invention, the means for preventing plug-connection from beneath comprises a joint part which includes two flat pieces, wherein a first flat piece is connected to a free bottom face of the moving part of the terminal body in a force-fitting, form-fitting and/or cohesive manner, and a second flat piece is mounted in the terminal housing in a displaceable manner.
