Abstract (en)

A method for controlling the combustion of a burner (1) comprising an ignition step of the burner (1), a subsequent step of detecting a combustion value (lono) representing a quality of the flame (4) and checking whether the detected lono combustion value falls within a range of predefined values (lonoMax and lonoMin). The method comprises a step of switching off the burner (1) if the combustion value (lono) detected falls outside said range of the predefined values and of repeating the ignition step to vary the flow rate of the fuel according to an ignition ramp (5) and/or a predefined initial value (lmodlgnMin) that are different to the ignition ramp (5) and/or to the predefined initial value (lmodlgnMin) used during the preceding step of igniting the burner (1).
