Abstract (en)

[origin: EP3184924A1] To achieve both of wind direction control by a louver and suppression of a feeling of draft, while maintaining a level of comfort, there is provided a control device (50) for an air conditioner including: an outlet for conditioned air; a louver that is pivotally provided at the outlet; an anti draft function that is pivotable between a withdrawn position and a louver-direction position; and a pivot mechanism, the control device including: a storage unit (51) that stores correspondence information for linking positional information on the louver to positional information on the anti draft function that blocks the conditioned air blown out from a position of the louver; and a control unit (52) that determines a position of the anti draft function corresponding to a current position of the louver based on the correspondence information and causes the anti draft function to move to the determined position.
