Abstract (en)
[origin: WO2017004707A1] A security video monitoring client system and method of presenting feeds within the same are disclosed. Out-of-process renderer components executing outside the client program provide an important performance advantage, particularly as to the number of video feeds to decode and/or render that can be decoded. This external thread execution strategy likewise facilitates fault isolation, shielding the client from undesired effects arising from the termination, restarting, and/or any other action to be taken as a result of anomalous operation of any one or more out-of-process renderer components.
