Abstract (en)
[origin: US2016066707A1] Embodiments disclosed herein are directed to a nursing pillow that positions the baby in an ergonomically beneficial position. Embodiments of such a nursing pillow may have a pillow body with a medial region and two arms. Medial region and arms may partially surround and define a central opening open between the arms so that the pillow may be worn around a mother's torso with the central opening encompassing the mother's torso. An inner surface is disposed between the central opening and the outer side. The inner surface faces the central opening and is sloped from a low point of the inner surface proximate the central opening to a high point of the inner surface proximate the outer side. As such, the inner surface is adapted to place a child in an ergonomic position facing a wearer with the head of the child above the stomach of the child
