Abstract (en)

[origin: WO2016059026A1] The invention relates to a stent for percutaneous vertebroplasty having a substantially tubular body, which can be transferred from a compressed state to an expanded state. Both, in the longitudinal direction and in the peripheral direction of the stent, the wall of the tubular body has a plurality of openings, which ensure the expansion. At least in the expanded state, the stent has a cross-sectional shape that deviates from a circular shape.
