Abstract (en)  
[origin: WO2016071162A1] The invention relates to a device, in particular a fitting assembly for windows, doors, or the like, comprising a face-plate rail, which is designed for fastening to a main frame or sash/leaf frame of the window, of the door, or the like, a locking bar, which can be moved along a longitudinal extent of the face-plate rail between a release position and a locking position, and at least one locking element arranged on the locking bar. The face-plate rail comprises an accommodating segment having an interior, in which the locking bar including the locking element is arranged, and comprising at least one insertion opening leading into the interior. According to the invention, the locking element arranged in the interior unblocks the insertion opening when the locking bar is in the release position and the locking element arranged in the interior at least partially blocks the insertion opening when the locking bar is in the locking position. The device can also be designed as a window, door, or the like, wherein the accommodating segment having the interior is provided in the main frame or sash/leaf frame.
