Abstract (en)
[origin: WO2016034934A2] A movement for a timepiece comprises a plate (1) and an annular module (2) circumferentially surrounding the plate (1). The module (2) comprises a mobile ring (2") mounted so as to be brought into rotation about the axis of same by a rolling means, the mobile ring (2") carrying a rotary indicator (3). The rotary indicator (3) is an attachment of which a first part (3A) fixed to a crown (5) arranged on the mobile ring (2") is flat and parallel to a plane defined by the crown (5) and a second protruding curved part (3B). The second part (3B), in the shape of a tip, is oriented towards the centre of the crown (5), the crown (5) comprising a housing for receiving one end of the first part (3A) of the rotary indicator (3); The movement further comprises a drive train (4) arranged to drive the mobile ring (2") in rotation at a speed of rotation imparted by the timepiece movement, such that, when it is driven around the periphery of the plate (1), the rotary indicator (3) displays time information indicating hours, minutes or seconds.
