Abstract (en)

The invention relates to a learning device for enhancing motoric sensation, the device comprising a board and at least two turning devices connected to the board, where the turning devices are adapted to allow the board to turn around the turning device when only one turning device is in contact with a substrate and where the turning devices are adapted to block movement of the board when two turning devices are in contact with a substrate. Hereby a turning device may comprise at least three wheels, each having a rotational axis and the wheels being arranged with the rotational axes of the three wheels crossing each other essentially at the centre of the turning device.
