Abstract (en)
[origin: WO2016041696A1] The invention relates to a door handle assembly (3) for a motor vehicle (1), comprising a handle carrier (6), a handle part (4) that is arranged such that it is strake-flush with a door (2) in a resting position and projecting out of the door (2) in an actuation position, a lever element (9) that moves the handle part (4), and a transmission element (15), wherein, for an electrically operated normal operation, the transmission element (15) is designed such that it can move in an entirely electrically driven manner into a first normal operation position, in which the transmission element (15) moves the handle part (4) into the actuation position via the lever element (9); wherein the handle part can be moved and actuated in order to open the door, even in the event of a failure of the motor drive. For this purpose, for a currentless emergency operation, the transmission element (15) is designed such that it can move from an initial position into an emergency operation position, in which the transmission element (15) swivels the lever element (9) at least in order to move the handle part (4) into the actuation position.
