Abstract (en)
[origin: WO2016041791A1] The invention relates to a refrigeration device, in particular a household refrigerator, comprising an evaporator (16) arranged in an evaporator chamber (15) and at least two storage chambers (2, 3) cooled by air exchange with the evaporator chamber (15). An inlet volume (17) is kept clear in the evaporator chamber (15) in front of an upstream side (18) of the evaporator (16) which communicates with the first storage chamber (2) via first intake openings (27) and with the second storage chamber (3) via second intake openings (29). A guide rib (31) extends in the inlet volume (17) in the longitudinal direction of the upstream side (18) and from a wall (32) opposite the upstream side (18) to the upstream side (18). The first and second intake openings (27, 29) are arranged on different sides of the guide rib (31).
