Abstract (en)
The present invention relates to a pump-type compact container characterized by being configured such that, when the user pressurizes a button portion, the button portion is moved downwards, and then restored by the elastic force of the button portion itself, thereby changing the pressure inside the container body and discharging the contents. Therefore, since contents having a high viscosity can be discharged easily through a simple structure, even if no separate pumping member exists, the present invention can shorten the assembly time and reduce manufacturing costs.
