Abstract (en)

[origin: WO2016046387A1] The invention concerns a reflector device intended to be attached in the horizontal position at an opening in a building, characterised in that it comprises: a plate (100) forming a reflector, a support casing (200) comprising attachment means (220, 230) suitable for receiving the plate (100) forming a reflector and allowing reflective plates (100) of different sizes to be attached to the support casing (200), the casing comprising reinforcing means (214, 216) suitable for supporting the plate (100) in the planar state without deflection along the entire length of same, - support means (300) for supporting the casing (200) on an element linked to the carcass of a building and means (400) incorporated into the casing (200), for angular adjustment of the inclination of the casing (200) about a horizontal axis (O-O) that coincides with a major axis of the plate (100) forming a reflector, relative to the support means (300), in order to make it possible to optimise the capturing and redirecting of daylight into the building.
