Abstract (en)

[origin: WO2016045832A1] The invention relates to a method (600) for creating a motion model (102) of a road user (200, 202), the method (600) comprising a reading step (602), a use step (604) and a determination step (606). In the reading step (602), a current motion vector (110) of the road user (200, 202) is read in. In the use step (604), motion vectors (110), which have been read in over a period of time, are averaged in order to obtain a characteristic motion value (112) of the road user (200, 202) for the period of time. In the determination step (606), a motion model (102) is determined using the motion value (112).
