Abstract (en)

[origin: WO2016046395A1] The present invention relates to an architecture (10) for observing a plurality of objects (18A,..,18N) arranged in geographically separate locations, comprising: - a processing center (14) connected to a global computer network (29), - at least one airliner (15) comprising: + a cabin system (33) comprising a local network (47), + a first external communication module (41), + a second external communication module (42), and + an intermediate communication module (43) connected to the first external communication module (41) via the local network (47) and to the second external communication module (42) via the local network (47), where the intermediate communication module (43) sends digital data comprising observation data between the second external communication module (42) and the first external communication module (41) via the local network (47).
