Abstract (en)

[origin: WO2016054013A1] The present invention relates to the discovery of a role of the nuclear receptor retinoid-related orphan receptor gamma (ROR γ) in tumor suppression. The introduction and expression of ROR γ result in genes activation within innate immune cells that trigger recognition and suppression of tumor cells. Thus, in various embodiments described herein, the invention encompasses a composition or a cell comprising a viral vector comprising nucleic acid sequences encoding ROR γ under the control of a neutrophil specific promoter. Additionally, the invention relates to methods of treating cancer by administering to a subject a composition that confers or increases innate immune cell anti-tumor immunity, methods for providing anti-tumor immunity in a subject, methods of stimulating innate immune response to a cell population or a tissue in a mammal and methods of diagnosing anti-tumor immunity response. Furthermore, the invention encompasses a kit for carrying out the aforementioned methods.
