Abstract (en)
[origin: WO2016055205A1] The invention relates to an angular fitting for fastening a frame (1) in a profile groove (14, 20) undercut on both sides, comprising an anchoring plate (16) on a corner angle of the frame (1) and for abutment against the undercut profile groove (20), wherein the anchoring plate (16) engages beneath at least one first limb (15) of the profile groove (14), and ensures abutment against the first limb (15) by means of a clamping piece (13) which lies opposite the first limb (15) and by supporting against the second limb (26). In order to guarantee the simplest possible installation of the wing on the frame, a rotary claw (22) which is arranged on a second angled limb (18) of the anchoring plate (16) and which can be associated with an adjacent frame limb (17) reaches abutment against a first limb (23) of the profile groove (20) of the second frame limb (17) when pivoting in the anchoring plate (16) and engages behind same in the opposite direction to the pivoting-in movement.
