Abstract (en)

[origin: EP4198738A1] A computer-implemented method for processing data generated by instrumented software. The method comprising: receiving metadata describing a data stream of a plurality of data streams, the metadata including a first set of attributes; quantizing data received for the plurality of data streams over an initial time interval. The method further comprising receiving an expression for aggregating quantized data, the expression based on an attribute of the first set of attributes; selecting at least two of the data streams matching the value of the attribute; removing any data streams having values not matching the value of the attribute; evaluating the expression using the selected at least two of the data streams over a plurality of time intervals to generate an output data stream. The method further comprising sending the output data stream for display through the user interface; and causing display of the output data stream through the user interface.
