Abstract (en)
[origin: WO2016057559A1] According to one embodiment, an online transaction verification system includes one or more processors configured to receive an indication that a card user is attempting to perform an online transaction using payment card information. The processors are also configured to transmit a challenge code configured to interrogate a card user identification device for a first verification code, and to receive the first verification code. The first verification code is selected, by the card user identification device, from a plurality of verification codes, and according to a predefined manner. The processors are further configured to select a first comparison code according to the predefined manner, and compare the first comparison code to the first verification code. The processors are further configured to, following a determination that the first comparison code matches the first verification code, transmit a verification signal configured to indicate that the online transaction has been verified.
