Abstract (en)
[origin: WO2016059031A1] The invention relates to a chair, in particular a conference or visitor chair, which allows a coupled movement of a seat (3) and a backrest. The seat in this case is mounted in sliding bearings (4) comprising oblique guide surfaces (6) and is displaced and raised in the sliding bearings through a mounting end (5) of the backrest. According to the invention, two separate backrest bars (11) are provided, which are connected to the mounting ends (5), wherein the backrest bars can be moved independently of each other. In this way, different seat positions can be realised. Besides an upright standard position, an inclined high position and an asymmetrical position, in which a one-sided load of a backrest bar (11) can be realised, with a corresponding displacement and rotation of the seat (3).
