Abstract (en)

[origin: WO2016059049A1] The invention relates to a connection arrangement for connecting a first component (2) to a second component (3). The connection arrangement has a screw (1) with a screw head (10) and a threaded shaft (11) which has an exterior thread (12). The connection arrangement further has a first component (2) with a mating connection piece (20) which has a support surface (21) and a collar (23). A depression (22) which encircles the collar (23) is formed in the support surface (21), and a protrusion (14) is arranged on a screw head (10) lower face (13) facing the collar (23), said protrusion being operatively connected to the depression (22) in the support surface (21) of the mating connection piece (20) in an assembled state of the screw (1), in particular with the interposition of the second component (3). The invention additionally relates to a vehicle seat (100) having a first component (2) and a second component (3) which are fixed by means of such a connection arrangement and to a method for producing such a connection arrangement. The invention further relates to a method for connecting a first component (2) to a second component (3) by means of such a connection arrangement.
