Abstract (en)  
[origin: WO2016062394A1] The invention relates to a device for winding hoses, preferably fire-fighting hoses, which can be easily mounted and operated in an optimal manner. According to the invention, this is achieved in that a first shaft (12) with a crank (14) is arranged about the middle of a rod-shaped, narrow housing (10), in that the right hand of a left-handed user grips a handle (11) located on the right longitudinal side of the housing (10) and the left hand turns the crank (14) located on the left longitudinal side of the housing (10) counterclockwise, in that a second shaft (13) rotatably mounted in the lower region of the housing (10) is coupled to the first shaft (12) in such a way that it rotates in the same direction of rotation and moves the device away from the user, along a hose laid on the ground, and in that the second shaft (13) does not rotate when the first shaft (12) is rotated clockwise. The device can thus also be operated, in that it is turned through 180°, by a right-handed user carrying out the usual rotation movements with the right hand gripping the crank.
