Abstract (en)
To provide a collapsible stick in which individual parts are prevented from being uncontrollably moved by elasticity of a connecting cord in transition from the collapsed state to the connected state and which can be brought into the connected state by a simple operation. Since the configuration is made so that a wire 7 that connects a first tube 1 having a grip with a second tube 2 having a ferrule is urged by use of a spring member 5 provided in the first tube 1 and so that a locking member 6 to which the wire 7 is attached can be locked, the stick can be operated without being affected by a biasing force of the spring member 5 in transition from the collapsed state to the connected state. Further, since an unlocking button 8 is provided for releasing the lock of the locking member 6, the stick can be brought into the connected state by a simple operation.
