Abstract (en)

[origin: EP3211169A1] A sash (1) for closing an architectural opening, comprising a weight-bearing frame (3), preferably in wood, and a cover frame (4), placed towards the outside, preferably in aluminium. The cover frame (4) comprises a structure (40) comprising upright elements (41) and transversal elements (42), the first having an upright cavity (410') and/or an upright groove (410''), the second a transversal cavity (420). The cover frame (4) comprises a plurality of locking elements (10), each comprising an upright portion (110) and a transversal portion (120), housed in the respective cavities. The upright portion (110) and the transversal portion (120) are mutually interacting in such a way that the snap-engagement between the transversal portion (120) and transversal element (42) transmits an action that forcibly locks the upright element (41) to the transversal element (42).
