Abstract (en)

[origin: WO2016067211A1] A closing device for a full face helmet having a shell for protecting the head, a chin guard, a visor (2) hinged on the shell and configurable in a closed position when it is lowered to match an upper profile of the chin guard, comprises locking means (4, 5a, 5b, 6) which pinch a pin (3) when the visor is closed, and which must be pressed on two opposite sides at the same time so that they leave the pinch on a pin and allow the visor to be lifted. The closing device according to the present disclosure has a pin which can be fixed on the chin guard or on the visor so as to protrude from it, and locking means which comprise a spring which can be fixed respectively on the visor or on the chin guard and ends with opposite arms which can be spread apart by overcoming an elastic return force of the spring, the opposed arms being configured so as to pinch the pin at least when the visor is in a closed position.
