Abstract (en)
[origin: WO2016067255A1] A hinge assembly is provided comprising two hinge components with a first hinge component having at least one pivot receiving cylinder (3) and a pivot leaf (2) adapted for attachment to a closure (5) or closure support. A second hinge component has a bracket leaf (11) and a slider leaf (12) one of which has an aligned pivot receiving cylinder (13) that receives a hinge pivot (14) connecting it to the pivot receiving cylinder (3) of the first hinge component. The other of the bracket leaf (11) and slider leaf (12) is adapted for attachment to the other of a closure support or closure. The bracket leaf (11) and slider leaf (12) have co-operationg formations (10) that provide for transverse adjustment of their relative positions in a direction transverse to the axis of the hinge pivot. A locking arrangement (16) locks the bracket leaf (11) relative to the slider leaf (12) in a desired adjusted relative position thereof.
