Abstract (en)

[origin: WO2016066395A1] The present invention relates to a device (10) for adjusting a mobile element, including: a frame (12), an element (16) which is mobile relative to the frame, at least three hinges (22, 46, 48) connected to the mobile element, and at least two linear actuators (26, 28) each comprising a body (30, 32) and a mobile rod (34, 36), a first end of each rod being connected to one of the three hinges, each body being rotatably mounted (38, 40) on the frame. Two of the linear actuators are linear motors with the rod passing therethrough, and a second end (50, 52) of each rod is capable of moving inside a recess (42, 44) arranged in the frame.
