Abstract (en)  
[origin: CN110785535A] The invention is directed to a vertical sliding window as a closure for an opening in an outer wall of a building, wherein at least one window pane of the sliding window can be lowered downwards, to be precise into a flat chamber within a box, for opening purposes. The sliding window can be supplied in the form of a finished module, with the option of integrating insulation and/or designing the facade; it is also possible to integrate a roller-shutter box, in particular also in heat-insulated form. The area of use for such a sliding-window component ranges from single-family dwellings to high-rise buildings of any conceivable height.
