Abstract (en)

[origin: WO2016070981A1] The present invention relates to a system and a method for monitoring the state of health of a vehicle occupant. The system comprises a control unit which comprises the following: a receiver for the wireless reception of physiological parameters of at least one unit which is worn on the body and which comprises one or more sensors for determining one or more physiological parameters of the vehicle occupant, and a diagnostic module which is designed to derive information regarding the state of health, the state of well-being or incidents of illness at least partially on the basis of the received physiological parameters. The control unit is also designed to provide the vehicle occupant, by means of at least one output unit of the vehicle, with information regarding the state of health, and to initiate at least one of the following steps: adapt vehicle functions to the state, or, by means of at least one output unit of the vehicle, propose or interactively carry out measures that improve the state.
