Abstract (en)
[origin: WO2016071313A1] A rail 18 has a guide surface 24 on which the locking block is guided in a bearing manner between a position locking the bar 10, in which the toothed side 16 engages in the toothed long side 13, and an unlocked position, in which the toothed side 16 is not engaged with the toothed long side 13. A spring 22 pretensions the locking block 15 into the locking position. The guided side 23 and/or the guide surface 24 have a flank 25 that is inclined with respect to the bar axis such that the locking block 15 is forced in the direction of the bar 10 in the event of a movement along the bar axis 12.
