Abstract (en)
[origin: WO2016073842A1] The present invention relates to a rotational vibration damper (2) comprising a base part (18) rotatable around an axis of rotation (16) and an inertial mass part (20) which is rotatable relative to the base part (18) and counter to the reset force of a reset device (36), wherein the reset device (36) has a spring unit (38) for generating a set force. The reset device (36) has at least one pivotable lever element (40) pivotable around a pivot point (46), via which lever element the set force is transmittable from a set force engagement point (42) of the lever element (40) to the inertial mass part (20) by generating the reset force affecting the inertial mass part (20) via a reset force engagement point (44) of lever element (40). The present invention further relates to a drivetrain (110) for a motor vehicle with a rotational vibration damper (2) of this type.
