Abstract (en)
[origin: EP3216504A2] The present invention relates to an attraction (1) for amusement rides provided with at least one support construction comprising two or more masts (12, 13) which converge from an underside toward an upper side. On the underside each of the masts is mountable on a base (100). At least one first mast (12) comprises two mast segments (12A, 12B) connected movably to each other. The attraction is provided with a number of passenger seats (31) which are connected rotatably to the support construction. The attraction is provided with positioning means (14, 15) for moving the mast parts (12A, 12B) of the at least one first mast relative to each other in order to move the support construction between a boarding position, in which the passenger seats are accessible to the passengers, and a position of use in which the passenger seats can execute the movements of the amusement ride.
