Abstract (en)
[origin: WO2016075679A1] A hair accessory device includes a male snap member and a female snap member. The female snap member mates with the male snap member. At least one of the snap members includes an aperture for feeding hair there through. The male and female snap members are moveable between a first position, in which a snap is formed and the hair is retained, and a second position, in which the snap is disengaged. A hair accessory is placed in communication with the male snap member, the female snap member, or both male and female snap members. Preferred, implementations employ pluralities of male and female snap member, and dual snap members.
